P700

Optional venetian blinds can be with electric or remote-controlled movement.

The full-height interior partitions P700 system consists of double glazed units with transparent polycarbonate extruded vertical mullions and high acoustic insulation gaskets. Transoms are of extruded aluminium with anodised or powder coated finishing. The glazed units can be personalised and are available in different combinations. According to different performances requirements, they can be of 10 and 12 mm width, both toughened and laminated.

Vertically, between the two panes of glass, there is a transparent polycarbonate profile and an acoustic seal that provide a connection without interfering with the transparency of the glass.

P700

This is a 100 mm thick double-glazed partition wall. The partition comprises a perimeter frame made of anodized or polished aluminium profiles containing two panes of glass. The structure, thanks to a micrometric telescopic movement, can tolerate floors and ceilings roughness and any possible movement due to floor flexure. Moreover, soft hard PVC strips are fitted on the profiles to ensure a perfect sound insulation.
